TRANSITIONAL GOVERNMENT OF ETHIOPIA
OFFICE OF THE POPULATION AND HOUSING CENSUS
COMMISSION
CENTRAL STATISTICAL AUTHORITY

THE 1994 POPULATION AND HOUSING
CENSUS OF ETHIOPIA
RESULTS FOR **ADDIS ABABA**
VOLUME I - STATISTICAL REPORT

AUGUST 1995
ADDIS ABABA

PREPARED AND PRINTED BY
CENTRAL STATISTICAL AUTHORITY
P.O.BOX 1143 ADDIS ABABA

FOREWORD

Statistical data that reflect the socio-economic conditions of the residents of a country are useful for designing and preparation of development plans and for monitoring and evaluation of the impact of the implementation of the development plans. These statistical data include population size, age, sex, fertility, mortality, migration, literacy and education, marital status, occupation, industry, housing stocks and conditions, ...etc. In order to fill the gap for these Socio-economic data need, Ethiopia conducted its second National Population and Housing Census in October, 1994.

The 1994 Population and Housing Census of Ethiopia was conducted under the auspices of the Population and Housing Census Commission that was set up under Proclamation No. 32/1992. The Commission was chaired by the Prime Minister and the members of the commission were drawn from various relevant ministries. The Central Statistical Authority served as the Office of the Commission (Secretariat). Hence the processing, evaluation and analyses of the data collected in this census as well as its dissemination are the responsibilities of this office. As stated above the census was conducted in October 1994 and the resulting data are processed and evaluated. Thus, the Office of the Population and Housing Census Commission is pleased to present the census report " The 1994 Population and Housing Census of Ethiopia: Results for Addis Ababa, Volume I- Statistical Report" for users. Addis Ababa is the Capital of Ethiopia and the largest urban center in the country. Another report which deals with the detailed analysis of the results of the 1994 Population and Housing Census data for Addis Ababa will follow shortly.

The 1994 Population and Housing Census was a huge nation wide operation which could not be undertaken by a single organization. Thus, full cooperation and assistance of government and non-

government organizations, external donor agencies and the public in general was obtained. A number of preparatory activities were also carried-out before the census enumeration was begun. Among the major census preparatory activities was the conduct of the Population and Housing Census Map Work. In the census map work the peasant associations in rural areas and the urban dwellers associations in urban areas were sub-divided into enumeration areas with 150-200 housing units in urban areas and 150-200 households in rural areas. About 5-6 contiguous enumeration areas were formed into one supervision area. In this exercise enumeration area and supervision area maps were also prepared. In the census map work operation a total of 58,702 enumeration areas and 11,420 supervision areas were constructed in the settled rural areas and all the urban areas of the country. In Addis Ababa a total of 2383 enumeration areas and 496 supervision areas were delineated.

During the census enumeration one enumerator was given the map of one enumeration area and was responsible to record all persons and housing units in that enumeration area. One supervisor was later assigned to the supervision area and was responsible for the quality of the information collected in that area.

The Office of the Population and Housing Census Commission would like to thank all government and non-government agencies who participated in the organization of the census, the supervision of the field work, the data collection, and the respondents who participated in providing the necessary information. The Transitional government of Ethiopia has given huge financial and unreserved administrative support in undertaking the 1994 National Population and Housing Census from its inception till the dissemination of the results. This indicates the commitment and high priority offered by the government for socio-economic data collection, processing, evaluation and dissemination of the results to users.

The Office would also like to take this opportunity to express its many thanks to the United Nations Population Fund (UNFPA) to its generous financial assistance and technical support in conducting the census. Moreover, thanks are due to United States Agency for International Development (USAID) for its financial and technical assistance for the census. Further thanks are due to the United Nations Development Program (UNDP) and to the Swedish International Development Authority (SIDA) for their financial assistance. The office hopes that the data presented in this report will be found useful by all data users.

Abdulahi Hasen (Ph.D.)

Member
and
Secretary,
Central Census Commission

CHAPTER VII - POPULATION PROJECTIONS

TABLE 7.1	Reported age and sex distribution of the population of Addis Ababa: October, 1994	214
TABLE 7.2	Population prjection of Addis Ababa by five years age group and sex, 1995 - 2000	215

CHAPTER I

INTRODUCTION

This chapter presents an over view of the content of the census report "The 1994 Population and Housing Census of Ethiopia: Results for Addis Ababa, Volume I- Statistical Report". It presents the major statistical tables that are essential to planners, administrators, researchers and other data users. The analytical report of the results of the census for Addis Ababa will be presented in a separate report, and will deal with indepth analyses of the results.

Addis Ababa has six zones and 27 weredas. The total number of urban kebeles is 305, while the number of rural farmers associations is 23. Out of the six zones only two have rural parts. There is no wereda that is entirely rural, and the number of weredas that have rural parts is only five. This report presents information on the rural and urban parts of the city, and wherever it is found appropriate the information that refers to the rural and urban parts is presented separately.

The 1994 Population and Housing Census was the second national population and housing census ever to be conducted in the country. The first population and housing census was conducted in May 1984 (CSA, 1987). Other surveys conducted for Addis Ababa include the 1978 Addis Ababa Demographic Sample Survey of September 1978 (CSA, 1979) and the Addis Ababa Manpower and Housing Sample Survey of December 1976 (CSA, 1977). Population Censuses were also carried out in Addis Ababa in 1961 and 1967.

The Second Population and Housing Census of Ethiopia was conducted beginning 11 October, 1994 and was completed in most areas within the following ten days. Eleventh of October, 1994 was used as the census day. The questionnaires used for the census were mainly in Amharic. English translations of all the questionnaires used in the census are presented at the end of the report. The

types of questionnaires used in the census were:

- i) Short Questionnaire (Appendix I)
- ii) Long Urban Questionnaire (Appendix II)
- iii) Long Rural Questionnaire (Appendix III)
- iv) Short English Questionnaire (Appendix IV)

The content of the short questionnaire was similar in urban and rural areas. The Short English questionnaire was administered only in Addis Ababa. This questionnaire was given to households in which the head was a foreigner. The Short English Questionnaire was a "self responding" one and the heads of the households filled in the required census data on the questionnaire themselves by reading the instructions that were given at the back of the questionnaire. The Amharic questionnaires were filled in by enumerators who went from one household to the next. All members of the household were recorded on the same questionnaire. The short and the long questionnaires differed on the number of variables collected. The short questionnaire collected basic data on population such as population sizes, sex, age, language, ethnic group, religion, and marital status. In addition to these, the long questionnaire included data on disability, education, economic activity, migration, fertility, mortality, and housing stocks and conditions.

The type of questionnaire administered to each household was determined by using a systematic sampling selection procedure. During the three days before the census day all households, and housing units were listed in a separate form designed for the purpose. This list was used to identify the type of questionnaire that were to be administered to the households. One out of five households was selected to be interviewed using the long questionnaire, while the other four were interviewed using the short questionnaire. Residents of hotels, hostels and other collective quarters were always interviewed using the long questionnaire. Short questionnaire was also administered on the

homeless persons. Short English questionnaires were administered to households in which the head was a foreigner.

Some of the information presented in this report which referred to population sizes, sex and age composition, language, ethnic, religious and marital distributions were collected from all persons covered in the census. However, some other information presented in this report was collected from only a sample of the population. This refers to disability, education, economic activity, migration, fertility, mortality, and housing stocks and conditions. Eventhough the above information was collected from a sample of the population, statistical weights were applied to the information collected, in order to let them represent the entire population. This means that the numbers presented in the tables that refer to education, economic activity,... etc. represent the entire population of Addis Ababa and not only the sample population.

The fact that the information was collected from a sample of households and not from the entire households does not make the information less reliable. In fact this process increases the quality of the information collected by reducing the work load that would have been faced if all households were covered using the long questionnaires. The reduction of the work load improves the quality of the data because it is expected to facilitate a closer supervision during field work, enable better data coding and editing, and enable the timely processing of the data collected.

The census was conducted by enumerators who went from house to house filling in the questionnaires designed for the purpose. Only in the case of Addis Ababa was a limited number of self responding questionnaires were utilized. These were questionnaires prepared in English and administered on households in which the head was a foreigner. This questionnaire contained detailed instructions on how the questionnaire was to be filled. During the census,

enumerators only checked the quality of the information recorded when they collected the questionnaires from such respondents. Homeless persons were enumerated in the place where they were spending the night.

This report contains seven chapters. The first chapter serves as an introduction to the report. Chapter II presents the population sizes, sex, age, language, ethnic, religious, and marital status distributions of the population. It also provides the disability condition in the city. Chapter III presents the educational characteristics of the population. Chapter IV deals with the economic characteristics in the city. Chapter V deals with migration, fertility and mortality conditions. Chapter VI deals on the housing stocks and conditions in Addis Ababa. Chapter VII presents population projection up to the year 2000.

Because of the use of sampling in the collection of some of the information in the census, slight discrepancies between the various tables may be observed. Tables that deal with population size, sex, age, language, ethnic group, religion and marital status refer to the entire population. Tables that deal with disability, education, economic activity, migration, fertility, mortality exclude the homeless and those who were covered using the short English Questionnaire. Similarly information on housing stocks and conditions excludes those housing units that were covered using the short English questionnaire. Since the population in these groups is very small compared to the population of Addis Ababa, the discrepancies are very small. Homeless persons were enumerated using only the short questionnaire because the enumeration took place at night at the place where they were sleeping, and it was not convenient to apply long questionnaires in these situations. Those that were covered using the short English Questionnaire were not required to respond to detailed questionnaires because of the inconvenience it could arise. The Homeless and those that were covered using the short English Questionnaire were not included in

the application of the statistical weights.

The tables presented here were selected from a long list of tables that have already been produced for Addis Ababa. The forthcoming analytical report for the 1994 Population and Housing Census data of Addis Ababa will present some of these detailed tables. The analytical report will concentrate more on providing indepth analysis rather than providing detailed tabulations at zonal and wereda levels. Analysis of the results of the census are expected to continue even after the production of the analytical report.

CHAPTER II

POPULATION SIZE AND DEMOGRAPHIC CHARACTERISTICS

This chapter presents data on population size by sex for Addis Ababa at zone, wereda, urban kebeles and rural farmers' associations levels classified into rural and urban areas. Also presented are population sizes by age, sex type of residence, household size, ethnic group, language, religion, relationship to the head of household, marital status and disability. The chapter consists of various tables which are self-explanatory. However, short definitions of some important terms and concepts used in the chapter are provided.

The first table of this chapter (Table 2.1) presents population size of Addis Ababa by sex classified into urban and rural areas. It also presents the population size of each zone and wereda. Table 2.2 provides the population size of urban kebeles while Table 2.3 presents the population size of farmers' associations in the rural parts of Addis Ababa. According to the 1994 Census, Addis Ababa's population was found to be 2,112,737, of which 1,023,452 were males and 1,089,285 were females. The population sizes refer to the de jure population size of Addis Ababa as of 11 October, 1994. De jure population comprises all the people who "belong" to a given area at a given time by virtue of usual residence (Shryock et al., 1973). In the census a person is said to be a usual resident of a household (and hence an area) if he/she has been residing in the area continuously for at least six months before the census day or intends to reside in the area for six months or longer. Thus, visitors are not included with the usual population. Homeless persons were enumerated in the place where they were spending the night. The 1994 Census includes foreign nationals who were residing in the city. On the other hand all Ethiopians living abroad were not counted.

Tables 2.4A - 2.4C classify population size by broad age group and type of residence. Type of residence is categorized in to two major groups, namely, conventional and non-conventional. Respondents who live in the same housing unit and have common cooking arrangements (eat their food together) are said to be residing in conventional households. The non-conventional population in turn is sub-divided into residents of collective quarters (hotel/hostel and other collective quarters) and the homeless. A collective quarter is a housing unit, a building, or a compound in which a number of unrelated persons reside together and share common facilities e.g. boarding schools, prisons, hotels, hostels,... etc. Homeless persons refer to individuals without any fixed residence.

The distribution of the number of members per household for the population living in conventional households is given in Table 2.5. A household often consists of the head, the spouse, their children and some other persons residing in the household. A person is considered to be a member of a household if he has the same cooking arrangement with the other members. The population size of Addis Ababa by single years of age and sex is presented in Table 2.6, while Table 2.7 provides the five years age group and sex distribution of the population for the zones and weredas. During the census, age of respondents was registered in completed years. Enumerators used several probing questions to get exact ages from respondents who did not know their exact ages.

Ethnic identity of a person is traced through his/her national or tribal origin. To assist the enumerators in recording the information, detailed list of the ethnic groups in the country, obtained from The Institute of Nationalities Study, was provided in the census enumerators' manual. In this report ethnic groups are listed down in alphabetical order, except where indentation is used to present related ethnic groups next to one another. For example the Kembata, Alaba, Kebena, and Timbaro are related ethnic groups.

For this reason all these ethnic groups are presented next to one another. To indicate that these are related ethnic groups, the words Alaba, Kebena, and Timbaro appear indented in the list after the word Kembata. The selection regarding which ethnic group will appear indented in the table does not imply that one ethnic group is dominant over the others. All the ethnic groups are treated independently and separate figures are presented for each.

The size of each ethnic group residing in Addis Ababa is presented in detail in Table 2.8. The ethnic group distribution of each wereda is provided in Table 2.9. However in Table 2.9 only ethnic groups that have 500 or more persons within the wereda are presented separately, while the rest are grouped together and presented as "others". This was done to keep the table to a manageable size. In the case of ethnic groups that are related, all the ethnic groups are presented in detail if their sum is 500 or more persons. For example the Kembata, Alaba, Kebena, and Timbaro are related ethnic groups and if their total number in a wereda reaches 500 or more persons all the ethnic groups will be listed in the table. The table will indicate the number of the Kembata, Alaba, Kebena, and Timbaro separately and not as a group.

Tables 2.10 presents population size by mother tongue. In the 1994 Census mother tongue is defined as the language used by the child for communication with his family members or guardians during childhood. Whereas second language is additional language used by the respondent. If the respondent uses more than one additional language, the one that is used more frequently is recorded. Similar to the previous table, indentation is used to present related language groups one after another. Table 2.10 presents the detail distribution of all mother tongues in the city while Table 2.11 presents the major mother tongues in each wereda. In Table 2.11 mother tongues with 500 or more persons in the wereda are presented separately while the rest are grouped together and presented as "others". In the case of related mother tongues, all the ethnic

groups are presented in detail if their sum reaches 500 or more persons. Table 2.12 provides all the second languages spoken in the city.

Religion is presented under four major groups; namely, Christian, Muslim, Others and Traditional. Christian is further subdivided into Orthodox, Protestant and Catholic. Orthodox Christianity includes the Kibat and Tsega while Seven Day Adventist, Pentecost, Lutheran, Baptist, Anglican, Presbyterian, Meserete Kirstos, Mulu Wengel, Kale Hiywot...etc. are presented as Protestants. Hindus, Jews, Behais, Johovas, Atheists etc. fall under the "others" category. Tables 2.13A - 2.13C present the religious distribution of the population by age group while 2.14 shows religious groups and their respective size of population for each wereda.

The 1994 census has also collected information on members of the household and their relationship to the head. The head of the household is any member of the household who is recognized as a head by the members. In a polygamous marriage where the wives have separated households the husband is considered to be the head of the household of the first wife. The other wives or other members (ex. elder son) is considered to be the head of their respective households. The data on relationship to the heads of conventional households is presented in Tables 2.15A - 2.15C and is limited to the total population and no breakdown by zones is presented because of the similarity of the distribution.

Marital status of the population aged ten years and over by age group and sex is presented in Table 2.16. Marital status is presented in four major groups; namely, single, married, divorced, and widowed. A person who had never been married is considered to be single; married persons include couples who are living together bonded by any kind of marital engagement at the time of the census (Traditional, Church, or Municipality); separated couples are also

considered to be married unless they had dissolved their marriage agreement. Any body who had been married but whose marriage was dissolved before the census day is categorized as divorced. A person who has not married again after the death of a spouse is categorized as widowed.

Table 2.17 presents disability status and type of disability by broad age groups and sex for the city. Table 2.18 provides disability status and type of disability by sex for each zone. Note that figures in these tables exclude self respondent households (i.e. households who were covered using the short English questionnaire) and the homeless. In the census a disabled person was defined as one who, due to physical or mental injuries, could not fully perform activities that other healthy persons could do. This represents decrease or loss of ability to discharge various social or economic functions. Disability is presented under ten major groups, namely; i) totally blind ii) partially blind (one whose eyes could only see partially or one who is blind on one eye); iii) hearing problems (totally deaf or partially deaf); iv) hearing and speaking problems; v) leg problems (lame, amputated or crippled); vi) hand/arm problems; vii) leprosy; viii) mental problems (epilepsy, madness, mental retardation, melancholia...etc); ix) other types of disability (different from what is specified above); and x) multiple disability (with two or more physical defects mentioned above).

CHAPTER III

EDUCATIONAL CHARACTERISTICS

This chapter presents data on educational characteristics of the population of Addis Ababa. The data was collected from members of the sampled household. Two questions on education were included in the census questionnaire to measure school attendance and educational attainment. The information was collected from persons who were covered using the long questionnaire. However, the information has been weighted and all the figures in this chapter refer to the entire population of Addis Ababa.

Every person aged five years and over in the sampled household was asked to report his/her educational status. The three alternative answers given were (1) attending school during the census day, (2) attended school in the past but left before the census day and (3) never attended. The resulting data is given in Table 3.1A, 3.1B, and 3.1C. Similarly, data on school attendance for zones classified by urban and rural areas is given in Table 3.2.

Those who were attending school during the census day were further asked to indicate the grade in which they were attending. The distribution of the population classified by age and grade attending is presented in Table 3.3A, 3.3B and 3.3C. In order to measure the proportion of students out of the school age population it is essential to compute gross and net enrollment ratios.

Gross enrollment ratio in primary education is defined as the ratio of students in primary education divided by total number of children aged 7-12 years (multiplied by 100 percent). Gross enrollment ratio in junior secondary education is the number of students in junior secondary education divided by total children aged 13-14 (multiplied by 100 percent). Gross enrollment ratio in

senior secondary education is the number of students in senior secondary education divided by children aged 15-18 years (multiplied by 100 percent). The gross enrollment ratio for primary, junior and senior secondary levels for both urban and rural areas are presented in Table 3.4. Enrollment ratios that exceed 100 indicate enrollment of over-aged children in each level. Since this ratio does not consider the age distribution of the enrolled population the net enrollment ratio was calculated.

Net enrollment ratio in primary education is defined as students in primary education aged 7-12 years divided by total children age 7-12 years (multiplied by 100 percent). Net enrollment ratio in junior secondary education is defined as students in junior secondary education aged 13-14 divided by total children age 13-14 years (multiplied by 100 percent). Net enrollment ratio in senior secondary education is the number of students in senior secondary education aged 15-18 divided by total children aged 15-18 persons (multiplied by 100 percent). The net enrollment ratio for the city is presented in Table 3.4. The distribution of population of zones classified by level of school and sex for both urban and rural areas is given in Table 3.5.

Data on educational attainment is also given in this chapter. Those who were attending school during the census day and attended in the past and left school prior to the census day were asked to state whether they were literate or not. If literate, respondents were further enquired to report the highest grade completed in the formal education system. Following the recommendation of the United Nations that states age of 10 years as the minimum age for compiling and analyzing data on educational attainment, Tables 3.6A - Table 3.6C and Table 3.7 present data on educational attainment for population aged 10 years and over.

The report in general and this chapter in particular refers to formal education only. "A formal education is defined as education

in which students are enrolled or registered regardless of the mode of teaching used. It includes both 'regular school and university education' and 'adult education'. All regular schools and university education is essentially formal. Adult education, however, can be formal and non-formal. The 1994 population and housing census covered only the formal component of the adult education and all regular and university education.

Regular and University education is used to describe the system that provides a 'ladder' by which children and young people may progress from primary schools through universities (although many drop out on the way). Adult education is used to describe out-of-school education, which provides education for people who are not in the regular school and university system and who are generally fifteen or older (although in some circumstances, younger students are accommodated along with their older colleagues)" (UNESCO, 1976).

CHAPTER IV

ECONOMIC ACTIVITY STATUS

In the 1994 population and housing census, information on economic activity status was collected for all persons aged ten years and over using the long questionnaire. The long questionnaire was administered only on selected households. The selection was done on the basis of systematic sampling and covered one fifth of the total households. However, statistical weights were later applied which makes the figures presented in this chapter to refer to the entire population. Information on economic activity collected in the census was:

- a) whether engaged in productive work during the reference period.
- b) reason for not being engaged in productive work during the reference period (for those who were not so engaged).
- c) major type of occupation.
- d) major product or service of the establishment or industry.
- e) employment status in the main activity.
- f) number of days worked during the last seven days for those engaged in productive work (for urban areas only).

The approaches used in the collection of the above information in urban and rural areas were different. The current status approach was employed in the urban areas, while the usual status approach was used in the rural areas. The main difference between the two approaches is in the length of the reference period. The current status approach is based on a short reference period, which in this case is the seven days before the census day. On the other hand, the usual status approach has a long reference period, that is, the twelve months before the census day.

In urban areas all persons aged ten years and over who were productively engaged for at least one day during the seven day

reference period were classified as economically active. In rural areas all persons aged ten years and over were classified to be participating in a productive activity if they were engaged in the production of economic goods and services during most of the twelve months prior to the census day. For those engaged in agricultural activities, persons who were engaged in agricultural and related work during most of the main agricultural season were classified to be economically active.

Economic or productive activity in the census was defined in terms of production of goods and services following the concepts presented in the United Nations System of National Accounts (SNA) production boundary (ILO, 1990a). Economic activity is defined as work which involves the production of goods or services for sell or exchange for other commodities including:- production and processing of primary products (agriculture, hunting, fishing, forestry and logging, and mining and quarrying) for own consumption, own account construction and fixed asset formation (expected life use of one year or more) for own use. Such activities could be performed for an individual, family or private enterprise, government establishment or public organization. The remuneration may be on daily, monthly, yearly or contract basis. However the activities of apprentices are considered as productive activity. On the other hand, unpaid household chores such as preparing food, cleaning the house, taking care of children or collecting firewood are not considered to be productive activities. In addition unpaid community and volunteer services and prostitution are classified as non-economic activities.

Economically Active and Non-active Population

The economically active population comprises all persons aged ten years and over who were employed and unemployed. The employed population consists of those who were engaged in productive activity for at least one day during the seven days prior to the census day for urban areas and most of the twelve months prior to

the census day for rural areas. Persons who had regular jobs but did not work during the reference period because of poor health, social reason, seasonality of work, annual leave or due to temporary closure of establishment were included as employed persons. The unemployed population consists of those who were not working during the reference period and were actively looking for work or were discouraged job seekers, that is, those who were not actively looking for work but were ready and willing to take up a job if one was available. A person who is looking for work but was engaged in a productive activity during the reference period is recorded as economically active and not as an unemployed person. The number of economically active and the non-active population is presented in Tables 4.1A - 4.1C. The tables also present activity rates which are defined as the percentage of the economically active over the total of the active plus the non-active population. Table 4.1 provides economic activity status by five year age group and sex. This table and the others in this chapter are limited to the entire population in the city and do not provide information for the different zones. This is because a person may be residing in a zone but his economic activity may be conducted in a different zone.

The reason for not being engaged in an economic activity (for those who were not so engaged) is presented in Tables 4.2A - 4.2C. The reasons are classified as: students, home makers, disabled, too young, pensioners, prostitutes and "others". However students, pensioners, ... etc. are considered economically active if they were productively engaged during the reference period. The distribution of the unemployed population by five year age group and sex is presented in Tables 4.3A - 4.3c.

Type of Activity

Employed persons were asked about the type of occupation, and major product or industrial group of the establishment in which they were engaged during the reference period and the status of

their employment. This information was also collected from unemployed persons who had previous work experience. The information collected from these persons referred to the job they held before they became unemployed. The information on type of activity was not collected from unemployed persons with no previous work experience. Therefore, analysis of economically active population by occupation, major product or type of industry of their establishment and status will be based on a number fewer than the total economically active persons by the number of unemployed persons who never had any work experience.

A national occupation and industrial classification code list was prepared for the census. This list prepared closely followed the International Standard Classifications of Occupation (ILO, 1990b) and International Standard Industrial Classification (UN, 1990) but took into account the prevailing national socio-economic conditions. These classifications were used for coding the responses on occupation and the type of industrial group of the establishment.

The distribution of the status in employment of the economically active population by five year age group and sex is presented in Tables 4.5A - 4.5C. The distribution of the economically active population by the major occupational group by five year age group and sex appears in Tables 4.6A - 4.6C. Sub major occupational groups by sex appear in Tables 4.7A - 4.7C. Table 4.8A - 4.8C present the distribution of the major industrial divisions classified by five year age groups and sex. Sub-major industrial divisions are presented for each sex in Tables 4.9A - 4.9C. The last table in the chapter presents the distribution of number of days worked for the employed population by sex. The table also presents the mean number of days worked by employed persons. The table is limited to urban areas only because the information was not collected in rural areas.

MAJOR GROUP 4 CLERKS.	49,812	22,220	27,592
Office clerks	38,798	17,163	21,635
Customer services clerks.	11,014	5,057	5,957
MAJOR GROUP 5 SERVICE WORKERS AND SHOP AND MARKET SALES SERVICES.	117,483	73,142	44,341
Personal and protective services workers.	38,088	19,413	18,675
Salespersons, models and demonstrators.	79,395	53,729	25,666
MAJOR GROUP 6 SKILLED AGRICULTURAL AND FISHERY WORKERS.	3,715	3,145	570
Market-oriented skilled agricultural and fishery workers.	1,779	1,475	304
Skilled subsistence agricultural and fishery workers.	1,936	1,670	266
MAJOR GROUP 7 CRAFT AND RELATED TRADES WORKERS.	117,357	95,194	22,163
Extraction and building trades workers.	23,237	22,432	805
Metal, machinery and related trades workers	30,840	29,929	911
Jewelers, potters, handicraft workers in wood and leather, and printing workers	7,108	4,569	2,539
Other craft and related trades workers.	56,172	38,264	17,908
MAJOR GROUP 8 PLANT AND MACHINE OPERATORS AND ASSEMBLERS.	50,307	45,184	5,123
Stationary-plant and related operators.	2,288	1,971	317
Machine operators and assemblers.	13,304	8,783	4,521
Drivers and mobile-plant operators.	34,715	34,430	285
MAJOR GROUP 9 ELEMENTARY OCCUPATIONS.	163,743	72,967	90,776
Sales and services elementary occupations	136,209	53,283	82,926
Agricultural, fishery and related labourers	1,059	823	236
Labourers in mining, construction, manufacturing and transport.	26,475	18,861	7,614
MAJOR GROUP 10 NOT STATED	32,976	21,645	11,331
Not stated.	32,976	21,645	11,331

Note:- The economically active population here excludes the unemployed who had no previous work experience.

TABLE 4.7C ECONOMICALLY ACTIVE POPULATION AGED TEN YEARS AND OVER BY SEX AND SUB-MAJOR OCCUPATIONAL GROUPS (ADDIS ABABA-RURAL): 1994

Sub-Major Occupational Group	Sex		
	Both Sexes	Male	Female
ADDIS ABABA-RURAL			
ECONOMICALLY ACTIVE.	12,511	7,837	4,674
MAJOR GROUP 1 LEGISLATORS, SENIOR OFFICIALS AND MANAGERS.	19	19	-
Legislators and senior officials.	19	19	-
General managers and department heads	-	-	-
Managers, section and sub section heads	-	-	-
MAJOR GROUP 2 PROFESSIONALS	28	24	4
Physical, mathematical and engineering science professionals.	9	5	4
Life science and health professionals	7	7	-
Teaching professionals.	-	-	-
Other professionals	12	12	-
MAJOR GROUP 3 TECHNICIANS AND ASSOCIATE PROFESSIONALS	70	50	20
Physical and engineering science associate professionals.	7	7	-
Life science and health associate professionals	-	-	-
Teaching associate professionals.	30	10	20
Other associate professionals	33	33	-
MAJOR GROUP 4 CLERKS.	89	67	22
Office clerks	67	50	17
Customer services clerks.	22	17	5
MAJOR GROUP 5 SERVICE WORKERS AND SHOP AND MARKET SALES SERVICES.	524	158	366
Personal and protective services workers.	213	46	167
Salespersons, models and demonstrators.	311	112	199
MAJOR GROUP 6 SKILLED AGRICULTURAL AND FISHERY WORKERS.	7,874	4,907	2,967
Market-oriented skilled agricultural and fishery workers.	150	105	45
Skilled subsistence agricultural and fishery workers.	7,724	4,802	2,922
MAJOR GROUP 7 CRAFT AND RELATED TRADES WORKERS.	825	565	260
Extraction and building trades workers.	409	395	14
Metal, machinery and related trades workers	85	85	-
Jewelers, potters, handicraft workers in wood and leather, and printing workers	139	5	134
Other craft and related trades workers.	192	80	112
MAJOR GROUP 8 PLANT AND MACHINE OPERATORS AND ASSEMBLERS.	273	220	53
Stationary-plant and related operators.	5	5	-
Machine operators and assemblers.	197	144	53
Drivers and mobile-plant operators.	71	71	-
MAJOR GROUP 9 ELEMENTARY OCCUPATIONS.	2,522	1,652	870
Sales and services elementary occupations	463	268	195
Agricultural, fishery and related labourers	1,722	1,111	611
Labourers in mining, construction, manufacturing and transport.	337	273	64
MAJOR GROUP 10 NOT STATED	287	175	112
Not stated.	287	175	112

Note:- The economically active population here excludes the unemployed who had no previous work experience.

TABLE 4.8A ECONOMICALLY ACTIVE POPULATION AGED TEN YEARS AND OVER BY AGE GROUP, SEX AND MAJOR INDUSTRIAL DIVISIONS (ADDIS ABABA-TOTAL): 1994

CHAPTER V

MIGRATION, FERTILITY, AND MORTALITY

The previous chapters in this report dealt on the description of the characteristics of the population. This chapter deals on the changes (dynamics) that are occurring in the population. These are migration, fertility and mortality. The first section of the chapter deals with migration and it will be followed by fertility and mortality.

A. MIGRATION

Information on migration of a population is of direct interest to planning and implementing agencies as well as academic institutions, because migration has a direct effect on the geographic distribution of the population. Moreover, migration has an interaction with other demographic forces as well as other aspects of social and economic changes. In recognition of the importance of this variable as one of the components of population change data on migration was collected in the 1994 Population and Housing Census of Ethiopia.

In the 1994 census two migration related questions were employed. These were: "Length of continuous residence" and "Place of previous residence". The former question provides information on the timing of migration while the later provides information on area of origin.

The length of residence of each person referred to the number of years the person has been continuously residing in Addis Ababa. The length of stay was recorded in completed years, and from the responses the migration status was determined. A non-migrant is a person who has been residing in Addis Ababa continuously since his/her birth. All other persons who were born outside Addis Ababa or persons who have not been living continuously since birth in Addis Ababa are considered as in-migrants. Return migrants are also considered to be migrants. These are persons who were born in Addis ababa but who at one time resided in a place outside the city.

In the census, the place of previous residence of migrants was also collected. The data on Place of previous residence was recorded as "rural" or "urban". This enables the classification of all migrants to Addis Ababa as migrants from rural areas or migrants from urban areas.

This section presents the main findings based on the two migration related questions discussed above. Tables 5.1A - 5.1C present the volume, age-sex structure, and place of previous residence (rural and urban) of in-migrants. Table 5.2 presents similar information about each zone but not classified by age groups. Tables 5.3A - 5.3C present the length of residence of the in-migrants to the city classified by age and sex of in-migrants. The duration of residence classifications used were less than one year, one year, two years, three years, four years, 5-6 years, 7-9 years and 10 years and above.

B. FERTILITY

This Section presents the fertility level of the population of Addis Ababa. In the 1994 Population and Housing Census Questionnaire information was collected on both current and retrospective fertility from every woman aged 10 years and over.

Data on current fertility was obtained by asking, "Did you have a live birth during the last twelve months prior to the census day?." Information on retrospective fertility was obtained by asking about the total number of children ever born alive, number of children living at home, number of children living elsewhere, and number who had died up to the census day.

Generally, data on current and retrospective fertility collected in censuses of developing countries are not usually free from error. Data on total number of children ever born may also be distorted due to recall-lapse and socio-cultural factors, above all, because of the extended family system in the country, the women are likely to include relatives with their own. Again, the various social practice associated with birth of small babies, especially those births that end in early death are likely to have been omitted from reporting. Another source of error in the reported number of children could be the inclusion of still births. These probable errors should be borne in mind while interpreting reported fertility measures presented in this section.

Reported Current Fertility

Based on the question asked about number of births given in the year preceding the census day, reported fertility measures were computed and presented in Table 5.5. The measures include crude Birth Rate (CBR), General Fertility Rate (GFR) and Total Fertility Rate (TFR).

The Crude Birth Rate refers to the total number of births occurring in a given year per 1000 mid-year population. The General Fertility Rate is defined as the number of births occurring in a given year per 1000 women in the reproductive ages (i.e. women aged 15-49).

The other fertility parameter which takes into account the age structure of the population is what is known as total fertility rate (TFR). Total Fertility Rate refers to the number of children a woman is likely to produce at the end of her reproductive period given the current age-schedule of fertility rate. Reported total fertility rate for Addis Ababa is about 1.8 children per women. The corresponding figure in urban and rural areas of Addis Ababa were 1.8 and 5.2, respectively.

20-39
The above mentioned fertility measures indicate only the level of fertility. Table 5.6 gives the number of women and births by age and the corresponding ASFR (the ratio of births to women in each age group). The age specific fertility rates reveal that about 75 percent of the total births given in the year preceding the census day are born by women in the age group 20-34. The women in the early twenties (20-24) and thirties (30-34) and late twenties (25-29) are the most fertile. The observed pattern of fertility by age group holds true for both urban and rural areas.

The analysis on current fertility excludes women who did not state number of births they had during the 12 months before the Census day. Hence the number of women in the various age groups in this table may not be consistent with other figures in the report. The reported level of age specific fertility rates for each zone are presented in Table 5.6.

Cumulative Fertility

The other fertility index of interest is the mean number of

children ever born presented in Table 5.7. Completed fertility is imputed from data on number of children ever born by women aged 45-49 years. Comparison of the mean number of children ever born at age group 45-49 and TFR, revealed wide variation in the urban and total data. One explanation for the observed variation could be due to recent decline in the fertility level among the population. The data on the number of children ever born by age group of women is presented in Table 5.7. The table excludes women who did not state the total number of children ever born. Thus, the number of women presented in this table also may not match with those in other tables.

The fertility measures reported in this section are all reported levels. No attempt has been made to make adjustments to the levels of fertility. Detailed analysis of the level of fertility will be made in the analytical report that will be forthcoming soon.

C. MORTALITY

For the analysis of mortality only one type of information was collected in the 1994 Population and Housing Census. The question was addressed to women in their reproductive ages and referred to the total number of children ever borne and the number surviving. To get the data, all women aged 10 years and over were asked the total number of sons and daughters they ever gave birth to, the total number living at home, and the total number living elsewhere and the total number that died. This information was then utilized to provide estimates of infant and under-five mortality and expectation of life at birth. These mortality indicators are defined as follows:

Infant mortality ($1q_0$): the probability of dying between birth and age one per 1000 live births during the year.

Under-five mortality ($5q_0$): the probability of dying between birth and age five per 1000 live births.

Expectation of life at birth (e^0): refers to the average number of years a new born baby is expected to live if he/she is exposed throughout its life to the prevailing pattern of age specific death rates.

In order to estimate these mortality indices the Trussell Variant of the Brass Indirect Technique (UN, 1983) was employed and the West Family of the Coale and Demeny Model Life Tables were selected as the standard pattern of mortality. But the reliability of indirect estimates based on children ever born and surviving data highly depend on the quality of reporting of children ever born, children dead and age of women. Thus, any bias in the reporting of these data might lead to over or under estimation of mortality. In the census the proportion of women in the reproductive age (15-49 years) who did not report their parity and number of children dead were found to be negligible, being around half a percent for the whole city. In view of

this, those women who did not state number of children ever born or number of children surviving are omitted from the analysis. Furthermore, it should be noted that since the estimates based on reports of women aged 20-34 have been proven to be relatively accurate than the estimates of younger and older women as a result the infant and child mortality rates provided were an average of the three age groups, namely 20-24, 25-29 and 30-34.

Infant and under-five mortality estimates along with the corresponding life expectancies at birth for the city of Addis Ababa as a whole and its Zonal, rural and urban sub-divisions are presented in Table 5.9. The data indicate an infant mortality rate of 78 per thousand live births and under five mortality rate of 108.7 for Addis Ababa. The expectation of life at birth for Addis Ababa was found to be 58.4 years for both sexes, 56.6 years for males and 60.3 years for females. Zonal variations are also indicated in the table. The data in Table 5.10 provide the distribution of number of children ever born, number surviving, and number dead by age group of women as reported during the census. This table was the basis on which the estimated levels of mortality were derived. More detailed analysis of the levels of mortality will be presented in the indepth Census Analytical Report that will be forthcoming.

CHAPTER VI

HOUSING CHARACTERISTICS AND CONDITIONS

The 1994 population and Housing Census included housing questions for urban and rural areas, and information on housing characteristics and conditions were collected for residential and partly residential housing units. The data collected show the housing stock, the quality of the housing unit, the housing facilities and amenities, and the status of tenure and monthly rent of housing units. In this chapter the data on housing units of Addis Ababa are presented from Tables 6.1 to Table 6.24.

In the census a housing unit is defined as a separate and independent place of abode either intended for habitation or not intended for habitation but was occupied as a living quarter by a household at the time of the census. A housing unit may at the time of the census be occupied by one or more households or may be used partly for living and partly for establishment. Different housing questions were employed in the rural and urban parts of Addis Ababa. The housing information collected in the urban areas was very detailed (Appendix II) while the housing information collected in the rural areas was very limited (Appendix III). Thus, during the presentation of the results, some tables refer to urban areas only, while some others may refer to both urban and rural areas. A few tables refer to rural areas only.

The quality of the housing unit is determined by its structure, number of rooms, and density of occupation. Thus, the information collected for each housing unit includes its type of building, type of construction material of walls, roofs, floors, and ceilings which indicated the physical quality of a housing unit. The data on number of rooms per occupied housing unit and number of persons living per room was also collected. Here it must be noted that the averages were calculated for conventional population and conventional housing units. In the census a room was

defined as a space enclosed by walls reaching from the floor to the ceiling or roof at least to a height of two meters and having an area of at least four square meters (i.e. a size large enough to hold a bed for an adult). Except for bath rooms, toilets and passage ways other rooms found in the housing unit were considered as rooms.

In urban areas information on housing facilities and amenities such as bathing, toilet, kitchen, source of water supply, source of power for lighting, type of fuel used for cooking, and availability of radio, television and telephone sets were collected during the census. On the other hand in rural areas information on type of fuel used for cooking, availability of toilet, source of water supply, information on whether there was a separate room in the housing unit that was used mainly as kitchen were collected. A kitchen is defined in the census as a room primarily used for cooking meals but due to lack of adequate rooms or space in the housing unit, some persons or some livestock may also spend the night in the kitchen. In urban areas information on whether a housing unit has traditional or modern type of kitchen was also collected. A modern kitchen is defined as a room that has piped water and sink.

In this chapter data on the status of tenure and monthly rent of housing units is also presented. Tenure refers to the arrangements under which the household occupied its living quarters. A housing unit is said to be owner occupied if it is owned by the occupant household and it is free from rent. A housing unit is considered as rented if the household living in it pays rent to kebele office or to Agency for the Administration of Rented Housing or to the private individuals or to other organizations. There are also housing units occupied by households paying difference in rent. These are households that own another housing unit elsewhere that is rented for a lesser rent compared to the rent of the housing unit the household is occupying.

CHAPTER VII

POPULATION PROJECTION

Population projection gives information on the size, structure and characteristics of the population in the future. The resulting projected population figures can be used for drawing development plans and for policy making. This chapter provides the projected population size of Addis Ababa by sex and five years age group for period from 1995-2000.

Methodology:

There are two main categories of methods for population projection: (a) procedures for projecting the population considering mortality, fertility and migration by age and sex (cohort component method); and (b) procedures for projecting the population using mathematical functions. The former technique is usually applicable to a longer time period projection under different variants, i.e., low, medium and high variants. In this report, a simple mathematical function (exponential) is used to project the population of Addis Ababa up to year 2000.

The population size of Addis Ababa obtained from the First Population and Housing Census of 1984 was 1,423,111, while the Second Population and Housing Census of 1994 reported a figure of 2,112,737. The average annual growth rate of the population during the year 1984 to 1994 was 3.79 percent. From the demographic point of view, the population change in an area is determined partly by the level of natural increase (the difference between births and deaths), and partly by the level of net migration (the difference between in moving and out moving population). When we look at the change in size of the population of a major city over many years it can also partly be due to changes in the boundary of the city.

Assessment of age structure of the population:

Information on age of the population collected in the census

often subjected to age mis-reporting. This is because some people do not know their true age and others do not report their age accurately. The indices and graphs of the age structure of the population have indicated that, there is some distortion of the reported age pattern of the population. This distortion on the reported age pattern of the population may be caused by age misreporting and migration. Despite some distortion on the age pattern, the reported age structure of the population obtained from the 1994 census was used as a base year population. The reported age structure of Addis Ababa population obtained from the 1994 census is given on table 7.1.

Assumptions:

The projection presented in this chapter is made under the assumption that the annual growth rate observed in the city between 1984-1994 (3.79 %) remains constant and this observed growth rate is applied on each year between 1995-2000. The reported age distribution obtained during 1994 is assumed to remain constant up to the year 2000. The assumption that age distribution will remain constant is some what unrealistic because changes in fertility and mortality will have an effect on age distribution. This assumptions may be revised when detailed population projections for Addis Ababa are made in the forthcoming Analytical report.

Projection Results:

Based on the above assumptions, the projected population results of Addis Ababa by sex and five years age group up to the year 2000 is given in Table 7.2. Figures in the tables refer to mid-year population of the indicated years.

This projection is made for a limited number of years and under very broad assumptions. This was made to provide figures that will be necessary by users who would like to use the projected figures, till detailed projections under various assumptions and for longer periods can be made. These detailed projections will be presented in the analytical report that will be forthcoming.
